

Kōan 6: Evolution of brain and body

- In humans (and animals) the brain and the body (and the environment) have been evolved together over millions of years
- Explore the evolution of the brain (the control algorithms) and the body (the sensor, actuator and structure) of a robot
- And/or, what about the environment?
- The students can use Webots (e.g. the YAMOR modular robot), Ludobots*, or any other suitable simulation suite
- What benefits can you find for evolving the mind and body concurrently? How can it play a role in future robot designs?

*Do you have other ideas?
Feel free to be creative!*
